Digital Equity for Students and Educators

Prepared by
Public Policy Associates, Incorporated

September 2020

Public Policy Associates, Incorporated is a public policy research, development, and evaluation firm headquartered in Lansing, Michigan. We serve clients in the public, private, and nonprofit sectors at the national, state, and local levels by conducting research, analysis, and evaluation that supports informed strategic decision-making.

119 Pere Marquette Drive, Suite 1C, Lansing, MI 48912-1231,
(517) 485-4477, Fax 485-4488, www.publicpolicy.com

Executive Summary

The fallout from the COVID-19 pandemic has made it impossible to ignore the nation's digital divide, which has exacerbated deep inequities in every community across the United States. For many school districts across the country, reliance on remote (mostly digital) instruction has continued into the fall. But remote learning requires digital technologies—access to broadband internet and one-to-one (1:1) computer devices—that an estimated 13.5 million school-age children (ages 5-17) lack. This digital divide threatens to widen pre-existing inequities and the opportunity to learn; putting the nation's most underserved school-aged children at risk.

Using Census data from the American Community Survey (ACS), Public Policy Associates, Inc. (PPA) estimated that one quarter of all school-aged children live in households without broadband access or a web-enabled device such as a computer or tablet. This inequality systematically tracks across historic divisions of race, socioeconomic status, and geography. Native students and students of color are much less likely to enjoy full connectivity than White students.

Under-resourced school-aged children are much less likely to have access to either broadband internet or a computer device other than a smartphone. Other inequalities include students: living in rural areas; in under-resourced households (below the federal poverty threshold); in homes that rent; and whose parents lack a high school diploma or GED. The persistence of the pandemic poses additional challenges, as students who are more likely to have a parent who can be at home having more access than those that cannot. Many educators across the country also lack sufficient digital technologies, which limits their ability to reach their students.

This report includes a summary of the findings, detailed tables on student and teacher access to digital technology across states (Appendix A), state maps of county-level estimates of broadband access for school-aged children (Appendix B), and state profiles with specific data for each state (Appendix C).

In light of these stark inequalities, this report provides a number of considerations, including public financial support of broadband access and (1:1) computer device access, professional support for educators, and an emphasis on digital literacy for educators, to help our schools reach every student regardless of whether they are in school or at home.

Introduction

The expanding use of technology for schooling—for use in both homework and remote learning—affects all students and staff both inside and outside the classroom. The Every Student Succeeds Act (ESSA) defines digital learning as “any instructional practice that effectively uses technology to strengthen a student’s learning experience and encompasses a wide spectrum of tools and practices.”¹ Students who do not have sufficient access to digital learning resources cannot fully participate in remote learning. In effect, students who lack such access are barred from the virtual classroom. This divide between those who have access and those who do not occurs in both urban and rural areas of the country and reflects historical structural biases, ableism, inequalities, and prejudices.

This divide between those who have access and those who do not occurs in both urban and rural areas of the country and reflects historical structural biases, ableism, inequalities, and prejudices.

Digital equity is about making sure all school-aged children have the basic resources—broadband internet and computer access—to meaningfully participate in remote learning from home, regardless of situation or condition. It also depends on having qualified, trained educators and instructional supports in place so that students and their parents can successfully navigate learning wherever they are.

When states closed their school buildings in spring 2020, educators only had a few days—or sometimes hours—to move their classes online. Despite these challenges, educators in every state adapted quickly. However, much of the instruction relied on virtual and digital technologies at that time. Because of this, many students were left without. There is an opportunity now to assess what was learned in the spring to better meet the needs of educators, students, and families in the future.

The digital divide has been with us for decades. Even in communities with good access to digital technologies, internet quality remains a concern. Affordability as well as access to a quality and/or sufficient number of suitable devices adds to the problem. As

¹ Every Student Succeeds Act, 20 U.S.C. § 6301 (2015), <https://www.congress.gov/bill/114th-congress/senate-bill/1177>.

a result, students from different backgrounds, economic conditions, geographies, and abilities are denied an equal opportunity to an education.

Recent school building closures due to the COVID-19 pandemic and the continued use of remote learning at the district level exposed a lack of access to digital technologies that disproportionately affect individuals and communities. In fall 2020, remote learning is being relied upon by many school districts as a way to provide safe learning opportunities and protect staff and students from COVID-19.

However, protecting students also includes solving the digital divide through immediate action as well as significant long-term federal and state infrastructure investments targeted at communities most in need. Inequities in digital technologies were known before the spread of COVID-19, but they have been exacerbated now that remote learning has assumed a more prominent role as parents are facilitating the education of their children and working from home.

Inequities in digital technologies were known before the spread of COVID-19, but they have been exacerbated now that remote learning has assumed a more prominent role as parents are facilitating the education of their children and working from home.

The biggest technology issue facing school-aged children and their families is equitable access to high-speed broadband internet.² Household access, not just access for school-aged children, is an important asset for families because it has been shown to have positive economic, social, and public health effects.

Figure 1 (below) shows the estimated percentage of school-aged children in households with broadband internet access in each county in the United States. Geographic differences are clearly visible between and within states and regions. Appendix B presents these estimated broadband percentages for each state at the county level.

² “The National Broadband Plan stipulates download speeds of at least 100 Mbps and upload speeds of at least 50 Mbps are considered as high-quality broadband,” from Elizabeth Mack, “Businesses and the Need for Speed: The Impact of Broadband Speed on Business Presence,” *Telematics and Informatics* 31, no. 4 (2014): 617-627.

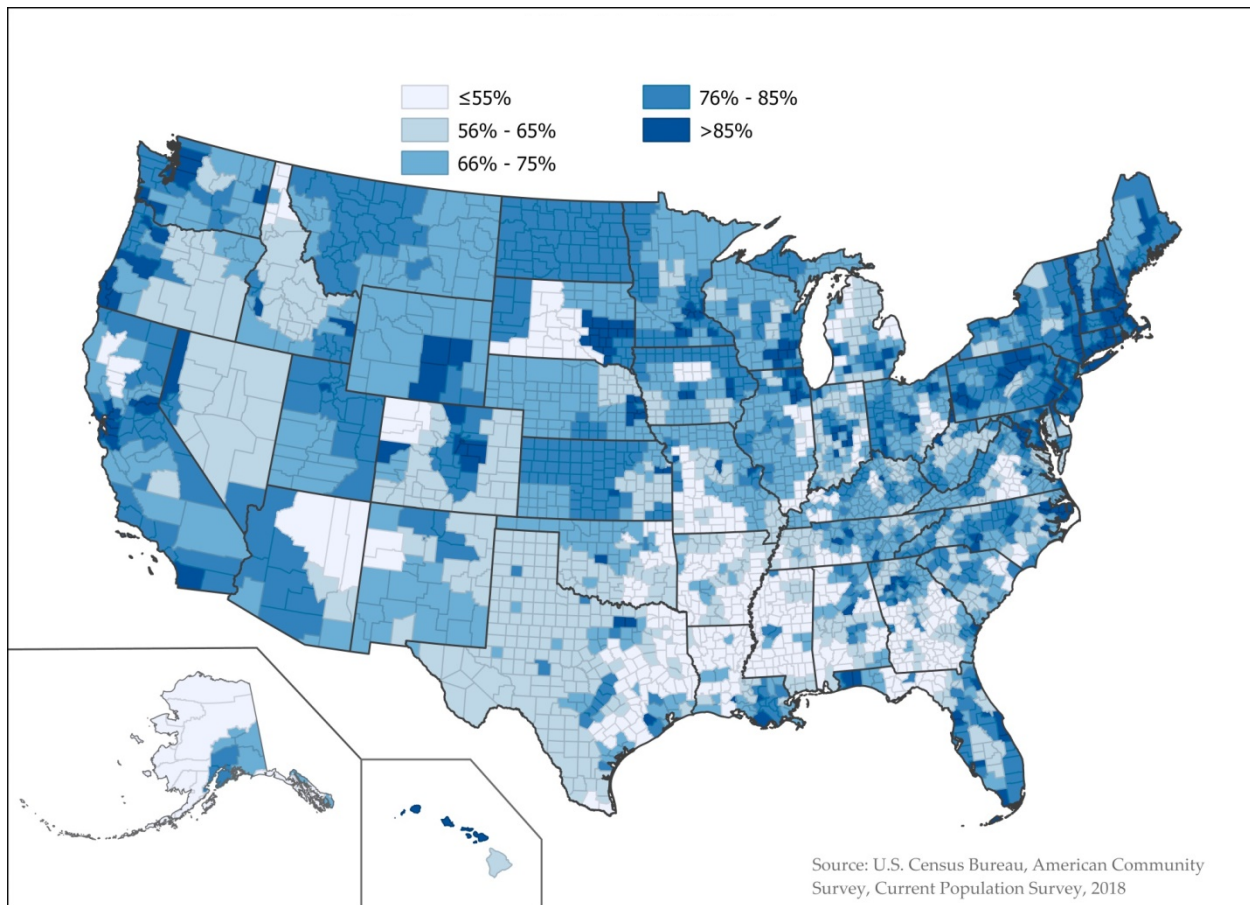

Figure 1. Estimated Percentage of School-Aged Children in U.S. Households with Broadband Access

Beyond broadband, access to web-enabled devices other than a smartphone (e.g., computers, laptops, tablets, or Chromebooks) is equally important. This report considers “full access” to remote-learning opportunities as having both broadband internet access and a computer device. This is necessary either for completing homework (under normal circumstances) or during times when school buildings are closed (such as those caused by the COVID-19 pandemic, weather-related events, or times of national tragedy).

According to U.S. Census Bureau’s American Community Survey (ACS) 2018 data, the latest available, approximately one out of every four school-aged children lack full access to digital technology at home. In total, that is an estimated 13.5 million school-aged children in U.S. households who lack either broadband or a computer.

The divide is worse among underserved populations, including Native students³ and students of color, students living in under-resourced households, students who are less likely to have a parent at home during remote learning, and those living in rural areas. The urban-rural gap alone is 14 points (77% of urban households have what can be considered full access compared to just 63% in non-metro or rural areas). The digital divide is especially wide in this country for under-resourced families (those earning under the federal poverty threshold), where the gap is estimated at 26 percentage points (79% for those above vs. 53% for those below).

At the state level, Mississippi, Arkansas, and New Mexico have the highest estimated percentages of students who lack full access (both broadband and a computer). Seven of the states that have the least access are among the 10 most under-resourced states in the country—based on U.S. household poverty threshold.⁴ Table 1 (below) ranks the states from those with the highest percentage of school-aged children lacking full access to the lowest.

Table 1: Number and Estimated Percentage of Students Without Full Access Ranked by State, 2018

State	# Children Without Full Access	% Without Full Access
Mississippi	239,353	45.9
Arkansas	214,427	42.1
New Mexico	131,925	37.2
Alabama	293,791	36.9
Oklahoma	242,089	35.0
Louisiana	277,284	35.0
Texas	1,765,574	33.0
Tennessee	333,807	30.4
Missouri	295,156	29.7
Kentucky	213,253	29.4
South Carolina	235,475	29.0
Indiana	328,988	28.9
District of Columbia	23,039	28.8
Alaska	37,297	28.1
Montana	45,279	27.9

³ The U.S. Census uses a category “American Indian and Alaskan Native (AI/AN),” which is utilized at times in this report instead of NEA-inclusive groupings.

Washington	221,031	18.5
Maine	33,159	18.3
Utah	121,686	18.0
Rhode Island	25,259	17.2
New Jersey	232,870	16.3
Connecticut	88,875	16.1
Massachusetts	150,896	15.1
New Hampshire	25,116	13.1

In terms of the total number of children affected by the digital divide, the three most populous states—California (with 1.5 million), Texas (1.8 million), and Florida (742,000)—have the most school-aged children who lack access. Texas, in particular, stands out compared than the rest of the country: 13.1 percent of all the school-aged children in the country who lack full access reside in Texas.⁵

Investigating the Digital Divide

Included with this report is a series of tables (see Appendix A) that examine access to the internet, broadband, computer, and full access in all 50 states. The tables provide estimates of the percentage of school-aged children who have access across a range of variables, including family income, race and ethnicity, urbanicity, parental education, and homeownership.

The data are presented for access in households that include a member of the essential workforce (e.g., health care workers, first responders, law enforcement personnel, or public health employees), households with individuals who are likely to be present during remote learning (e.g., managers, researchers, scientists, computer programmers, or software developers, and parents not in the workforce), and for teachers.

Additional appendices provided include: (1) maps of broadband access by county for every U.S. state in Appendix B; and (2) 51 state-level profiles, including the District of Columbia, in Appendix C.

Benchmarking

A recent report from Common Sense Media (CSM) and Boston Consulting Group (BCG) estimated that approximately 15 million to 16 million students (close to 30%) live in households either without an internet connection or device suitable for distance learning at home.⁶ Those figures are slightly higher than what is described in this

⁵ An estimated 8.8 percent of the U.S. population lives in Texas. From: “Quick Fact, Texas, 2019,” U.S. Census Bureau, Population Division, accessed August 24, 2020, <https://www.census.gov/quickfacts/fact/table/US,TX/PST045219>.

⁶ Sumit Chandra et al., *Closing the K–12 Digital Divide in the Age of Distance Learning* (Boston, MA: Boston Consulting Group, 2020).

report—using ACS (2018) data alone PPA estimates that 13.5 million (25%) of school-aged children lack access to both broadband and a computer.⁷

The number of K-12 students in the United States without broadband and their own personal computer is likely substantially worse than these reports estimate. Because the ACS collects data on whether a device is present in the household, not whether there are enough for every person to use or the quality of the device, it does not account for children who share computer devices with others in the household.

Another report from the Quello Center at Michigan State University found that dependence on smartphones was quite common in rural areas—further limiting access to rural students even before the pandemic.⁸ It may be that students can access information on smartphones, but being able to do research, write papers, or collaborate with educators and their fellow students is limited on those devices. Beyond simply identifying a gap among rural students in Michigan, the Quello Center found that rural students in Michigan who do not have access to the internet or are smartphone dependent had fewer digital skills, completed less homework, and had a lower grade point average than students with full access.

A report conducted for the Alliance for Excellent Education (All4Ed), National Indian Education Association (NIEA), National Urban League (NUL), and UnidosUS also found that the digital gap disproportionately harms Native students and students of color, students living in under-resourced households, students with disabilities, and those living in rural areas.⁹

The All4Ed study called on Congress to appropriate the \$6.8 billion this year to close the digital gap. The CSM/BCG report estimated that the cost to provide computer devices and connectivity for K-12 students to access remote learning this year at between \$6 billion and \$11 billion.

⁷ The CSM/BCG report used multiple data sources, including 1- and 5-year ACS data combined with data from the National Center for Education Statistics (NCES), which resulted in a larger estimation. The present study relies only on individual-level 1-year ACS data (2018).

Findings

Summary of Key National Findings

Utilizing existing data from ACS, Public Policy Associates, Inc. (PPA) found that roughly one fourth (25%) of school-aged children across the country lack either broadband access or a computer—the tools necessary to fully engage in digital learning. Because the number of devices available is not known in each household, it is likely that fewer students have 1:1 access to their own device to access remote learning than has been reported.

As states move toward remote learning with an emphasis placed on synchronous learning opportunities, having a computer or device other than a smartphone for each child capable of accessing remote learning is necessary to achieve digital equity.

- School-aged children in households that are below the federal poverty threshold are much less likely (53%) than those above (79%) to have access to both broadband and a computer.¹⁰
- Children whose parents are homeowners are more likely to have full access (82%) than renters (63%).
- Parents' educational attainment is a factor, with those with advanced degrees having the most access (91%).
- White school-aged children (80%) have better access than African-American/Black (64%) or Hispanic/Latinx (66%) children.
- Just 50 percent of American Indian and Alaskan Native children¹¹ have full access.
- Families who are likely to have a parent at home during times of remote instruction (e.g., managers, researchers, scientists, computer programmers, or software developers), and those who are not in the labor force, are more likely to have full access than those who do not (77% vs. 71%).

¹⁰ Income seems to be the primary driver of digital inequity, although an inferential analysis for establishing whether patterns or relationships exist will be necessary.

¹¹ "American Indian and Alaska Native (AI/AN) refers to a person having origins in any of the original peoples of North and South America (including Central America) and who maintains tribal affiliation or community attachment," from U.S. Census Bureau, <https://www.census.gov/history/pdf/c2010br-10.pdf>.

Figure 2 (below) shows the national estimated overall percentages of school-aged children in households with access to the internet, broadband, computers, and full access (both broadband and a computer).

Figure 2. Estimated Percentage of school-aged children in U.S. Households with Internet, Broadband, Computer, and Full Access, 2018

Computer and Internet Use by Selected Characteristics

Perhaps the most important gap seen in these data is the income gap between families that are below the federal poverty threshold, where 53 percent of households lack full access compared to 79 percent for households above the threshold. Table 2 (below) shows the percentage of school-aged children with access based on income.

Table 2: Estimated Percentage of U.S. Students With Internet, Broadband, Computer, and Full Access, by Income Status, 2018

Federal Threshold	Internet	Broadband	Computer	Full Access
Below	86	58	75	53
Above	96	81	94	79

Geography is another important barrier to remote learning, with families with school-aged children much less likely to have full access in non-metro or rural areas versus metro areas. Table 3 (below) shows the estimated percentage of school-aged children with access based on urbanicity (those living in urban centers).

Table 3: Estimated Percentage of U.S. Students With Internet, Broadband, Computer, and Full Access, by Geography, 2018

Urbanicity	Internet	Broadband	Computer	Full Access
Non-Metro	91	66	87	63
Metro	95	80	91	77

Table 4 (below) shows the estimated percentage with access to the internet, broadband, a computer, and full access reported by race. When looking at the percentage of households across the United States with full access, the gaps are substantial—with a nearly 30-point gap existing between White students and American Indian and Alaskan Native (AI/AN) students. Only 64 percent of Black and 66 percent of Hispanic/Latinx school-aged children have full access.

Table 4: Estimated Percentage of U.S. Students With Internet, Broadband, Computer, and Full Access, by Race/Ethnicity, 2018

Race/ Ethnicity	Internet	Broadband	Computer	Full Access
White	97	81	95	80
Black	91	69	83	64
AI/AN	81	54	75	50
Asian American	98	87	96	86
Multi-race or Other	97	82	93	80
Hispanic	92	70	85	66

Another particularly stark difference in access can be found for level of parental education. Nine out of every ten (91%) children whose parents have advanced degrees have full access, compared with less than half (48%) of children with parents that have not completed high school. Table 5 (below) shows the estimated percentage of school-aged children with access based on parental education.

Table 5: Estimated Percentage of U.S. Students With Internet, Broadband, Computer, and Full Access, by Parental Education, 2018

Parental Education	Internet	Broadband	Computer	Full Access
< High School	83	54	70	48
High School/GED	90	65	81	61
Some College	95	76	92	74
Bachelor's	98	87	98	86
Advanced	99	91	99	91

Among the workforce data analyzed for this study and included in the tables in Appendix A, there are differences between those that can be considered part of the essential workforce and other workers who may be able to remain at home. Table 6 (below) shows the estimated percentage of school-aged children with access based on parental essential workforce status.

Table 6: Estimated Percentage of U.S. Students With Internet, Broadband, Computer, and Full Access, by Essential Workforce Status, 2018

Essential Workforce	Internet	Broadband	Computer	Full Access
No	94	76	90	74
Yes	96	81	93	79

Computer and Internet Use by Teachers

Nationally, teachers¹² generally report having good internet access (98%), but broadband access for teachers is just 85 percent—meaning that during times of synchronous remote instruction (e.g., Zoom, Google Meet, or Microsoft Teams) many teachers are relying on low-bandwidth internet access. In addition, only 84 percent of teachers have access to both broadband and a computer device other than a smartphone. Figure 3 (below) summarizes the national teacher data.

¹² The estimates used in this report are for multiple teacher categories as reported by the U.S. Census and explained in the research notes. Other classifications, such as education support professionals, administrators, and those who work at higher education institutions, are not included.

Figure 3. Estimated Percentage of U.S. Teachers with Internet, Broadband, Computer, and Full Access, 2018

At the state level, full access (broadband and a device other than a smartphone) for teachers varies greatly between states and regions, with just 64 percent of teachers working in Alaska having both. Teachers in Rhode Island (94%), Connecticut (91%), and New Hampshire (90%) have the best access to broadband and computers. These data are also included among the tables in Appendix A. Additionally, it should be noted that because teachers often pay for their own internet access at home, as opposed to accessing it at school, they are paying out of pocket for the connectivity they need to teach school-aged children remotely.

Considerations for Closing the Digital Divide

Many questions remain regarding how best to close the digital gap in the United States, but one thing is clear: intentional investment and planning by stakeholders for in-school and out-of-school digital access during COVID-19 and beyond are necessary. Meeting the needs of all students and educators will require immediate-, medium- and long-term strategies and additional funding in infrastructure and educator training to reduce and eventually eliminate historical, institutional, and structural barriers to access of critical digital learning technologies. Public Policy Associates, Inc. has identified several policies and practices for policymakers and education leaders to consider as they seek to address the opportunity gap caused by lack of digital-technology access.

First, in advancing digital equity, policies and practices should be in place to ensure that all students have access to both broadband internet and a device other than a smartphone suited to remote learning. Every student is entitled to appropriate and relevant digital resources for learning.

Similarly, educators across the nation will need ongoing support and professional learning opportunities—including high-quality, culturally relevant, and interactive professional development—to effectively teach remotely. In addition to ensuring they have digital technology resources, educators need to be aware of instructional practices that may leave some students behind.

The pandemic has made clear the need to have highly qualified educators leading instruction, whether in person or remotely. Even as students safely return to in-person instruction, digital technologies should be used to enrich student learning rather than supplant in-person instruction. Digital technologies are a tool to enhance instruction for students and educators, but they cannot replace face-to-face instruction.

To move toward digital equity for all students, the following policies and practices should be considered:

1. Affordable high-speed broadband should be available to all in the United States—akin to a public utility like electricity or water—regardless of race, zip code, disability, sexual orientation, gender identity and expression, family status, employment status, economic background, or geographic location.

2. Every student should have access to their own device (1:1) that is internet-capable, contains the software necessary for school work, has a keyboard, and has a web camera for use during remote learning and beyond provided at no cost to students.
3. Schools should evaluate what was learned during the time when schools were closed in spring 2020 to support all students and minimize future learning disruptions, including the collecting and sharing of data on students who needed technology and households that need additional assistance.
4. The federal government should provide sufficient funding and the coordination necessary for schools, with states and other stakeholders collaborating, to close the access gaps made worse by the COVID-19 pandemic, including ensuring that all students have equitable, affordable access to broadband and devices.
5. Students should have access to digital assistance and technical support after school hours and when school buildings are closed—this includes secure adaptive technologies to meet individual student needs such as those for English learners and differently abled students.
6. Educators around the country should develop innovative strategies (beyond the internet) to connect with students in authentic and supportive ways that do not leave some students out (e.g., requiring students to print materials). Educators and schools should be equipped with the tools needed to equitably meet students where they are, regardless of whether instruction happens at home or in school.
7. Content and instructional practices should be developed with direct input from educators to maximize student participation in remote learning, increase engagement, and provide meaningful ways to foster student collaboration and innovation.
8. Educators should be supported by ongoing professional development that includes racial bias training to create an inclusive learning environment either at home or at school—reducing and unlearning deficit ideologies.
9. Training in digital-literacy instruction is necessary, especially as schools shift from in-person to remote learning during future disruptive events.
10. School districts, with the assistance of the federal government and states, should ensure full access to digital technologies—both broadband and computer devices—for Native students and students of color, students living in under-resourced households, students with disabilities, those living in rural areas, and educators.

Data and Methodology

Public Policy Associates, Inc. (PPA) researchers have analyzed broadband access for families with school-aged children across the nation. PPA previously released an issue brief in April 2020, *Digital Inequities and Disparities: Technology Access for Michigan Students*, which examined the disparities in access between Native students and students of color, students living in under-resourced households, students who are less likely to have a parent at home during remote learning, those living in rural areas, and others in Michigan. A companion brief, *Closing the Digital Divide for Students in Texas*, commissioned by the Texas State Teachers Association (TSTA) and released by PPA in August 2020, looked at digital access in Texas.

These data are drawn from the American Community Survey (ACS), which is distributed by the U.S. Census Bureau. The data and methodology decisions are explained below. The ACS is a continuous data-collection effort used to produce annual estimates at the national, state, and local levels on the characteristics of the U.S. population. The data for this report come from 2018, which is the most recent year available.¹³ One-year data from 2019 will not be released until later in 2020.

Since 2013, the ACS has collected data required under the 2008 Broadband Data Improvement Act. Data collected through the Current Population Survey (CPS) potentially include more detail through its longer questionnaire and longer time series. However, the ACS, with a larger sample, provides better estimates for small population groups and with more details related to geographic area.¹⁴

Three relevant ACS questions that have been asked since 2016 related to internet access, broadband, and computer devices were included in these data with those relying on smartphones coded as not having a computer device.¹⁵

¹³ As of August 31, 2020.

¹⁴ Camille Ryan, "Computer and Internet Use in the United States: 2016," U.S. Census Bureau, August 2018, accessed April 10, 2020, <https://www.census.gov/content/dam/Census/library/publications/2018/acs/ACS-39.pdf>.

¹⁵ This is reported as estimated percentage of school-aged children in households with internet access, children with internet access by type of internet subscription (broadband), and children with computer devices other than a smartphone.

Data were downloaded from the ipums.org website,¹⁶ which maintains formatted ACS data. This analysis used both household and individual-level variables. Respondents who resided in group quarters and did not have family income data were excluded. Because the focus of this report is the availability of and access to technology for school-aged children, the sample was restricted to households with individuals who were between 5 and 17 years of age.¹⁷

ACS demographic and geographical data were used to identify inequalities in access to technology, including race and ethnicity, income status, and geography. Estimates and standard errors were derived using standard techniques.

Research Notes

- Sample sizes are often too small to identify statistically significant differences between counties or groups of counties, thus the data for this report are presented at the state and national levels.
- Although the analysts considered using the five-year ACS sample, this possibility was rejected because: (a) there might be differential trends in technology access over time; and (b) the ACS question on internet access was changed in 2016.
- Race and ethnicity at the state and national levels were re-coded as White, Black, Asian American,¹⁸ American Indian and Alaskan Native (AI/AN), Multiple Races (includes “Some Other Race”), and Hispanic. Hispanic was treated as an inclusive category (so that all other racial/ethnic categories are non-Hispanic).
- Family income status at the state and national levels was determined using the ACS total family income variable. All school-aged children living in families with total income below the 2018 federal poverty threshold were coded as being “below” the threshold with all others being “above.”

¹⁶ Steven Ruggles, Sarah Flood, Ronald Goeken, Josiah Grover, Erin Meyer, Jose Pacas, and Matthew Sobek, IPUMS USA: Version 10.0 [dataset], Minneapolis, MN: IPUMS, 2020, <https://doi.org/10.18128/D010.V10.0>.

¹⁷ Other reports using these data sometimes use a broader definition “households with children” or households. Because this report is focused on the impact of the digital divide for K-12 schools, a more narrow definition was used.

¹⁸ These estimates represent the number of people who reported a specific detailed Asian group alone, as well as people who reported that detailed Asian group in combination with one or more other detailed Asian groups or another race(s).

- Metropolitan status at the state and national levels was determined by collapsing all households in a federally defined metropolitan area (which includes suburbs) into a simple binary or 1/0 dichotomy.¹⁹
- Estimates for homeownership are not available at the individual block level from the ACS as they are from the decennial census.
- Teachers for these data are limited to primary and secondary K-12 teachers, and exclude preschool/kindergarten and special education teacher classifications.
- Parental occupational categories used to define whether parents were likely to be able to work at home or were essential workers were coded based on ACS occupational categories aligned with Bureau of Labor Statistics (BLS) Standard Occupational Classification (SOC) codes. The IPUMS data set merges several SOC categories. The authors of this report compared the ACS SOC categories against SOC codes of workers capable of working at home or to be essential workers as defined in a Federal Reserve Bank of St. Louis analysis.²⁰
- Estimates of whether a parent is likely to be at home during remote learning are defined as: (1) households where at least one parents is not in the labor force; or (2) employed parents having occupations that make it likely that they would be able to work remotely during the pandemic.²¹
- Estimates of the number of children whose parents are either unemployed or able to work at home may be biased upward, as they assume that all employed parents able to work at home during a shutdown will continue to do so in fall 2020. Approximately one-third of school-aged children in households in the 2018 ACS sample had a parent in the home not in the labor force.
- Parental education was coded based on the highest level of education for either parent.
- Employment estimates include parents of school-aged children in two-parent families where both parents are in the workforce, and children in single-parent families where the single parent is in the workforce.
- Estimates were weighted using individual-level weights, and standard errors produced through balanced replicate weights. Standard errors are not reported

¹⁹ There were no metro observations for the state of Wyoming. New Jersey, Maryland, and Massachusetts had no observations that were non-metro.

²⁰ Charles Gascon, Federal Reserve Bank of St. Louis, "COVID-19: Which Workers Face the Highest Risk?" On the Economy Blog, March 24, 2020, <https://www.stlouisfed.org/on-the-economy/2020/march/covid-19-workers-highest-unemployment-risk>.

²¹ Ibid.

where 100 percent of the sample was in a given category. Estimates are not reported if the coefficient of variation is 40 percent or higher, due to low reliability.

Appendix C: State Profiles ---

Alabama

K-12 Student Digital Access

This is a summary of the estimated digital access for Alabama. The state-level profile is based on the latest available American Community Survey (ACS) micro-level data from 2018. The analysis was prepared by researchers at Public Policy Associates, Inc. (PPA) on behalf of the NEA. Because of standard errors, apparent differences might not be statistically significant. Full digital access includes both broadband and a device.

Children Ages 5-17 in the State

795,570

Children without Full Access

293,791 (36.9%)

Full Access by Income

Figure 1: Children Ages 5-17 in Households with Full Digital Access (both broadband internet and a device) by Income Level Estimated as Below or Above the Federal Poverty Threshold

- 66% of children living in under-resourced households (below the federal poverty threshold) have a device other than a smartphone, compared to 91% of children in households at higher income levels.
- 44% of children in under-resourced households have broadband access; 73% at higher income levels.

Full Access by Race/Ethnicity

Figure 2: Children Ages 5-17 in Households with Full Digital Access (both broadband internet and a device) by Race/Ethnicity. +At times, this report uses terms from U.S. Census data (e.g., American Indian/Alaskan Native) and not NEA-inclusive groupings.

- 74% of African-American/Black children have access to a device other than a smartphone at home, as compared to 91% of White children. 59% of Black children have access to broadband.
- 73% of Hispanic/Latinx children have a device at home, and 48% have access to broadband internet.

Who Lacks Full Digital Access?

45% of children in households with at least one unemployed parent

35% of children in households with a parent at home for remote learning

29% of children in households with a member of the essential workforce

48% of children with parents without a bachelor's degree

31% of children in metro households

51% of children whose parents are renters

54% of children in non-metro households

29% of children whose parents are homeowners

62%

of children in under-resourced households lack full digital access

47%

of Native students and students of color do not have access to broadband and a device

23%

of teachers do not have access to broadband and a device at home

Alaska

K-12 Student Digital Access

This is a summary of the estimated digital access for Alaska. The state-level profile is based on the latest available American Community Survey (ACS) micro-level data from 2018. The analysis was prepared by researchers at Public Policy Associates, Inc. (PPA) on behalf of the NEA. Because of standard errors, apparent differences might not be statistically significant. Full digital access includes both broadband and a device.

Children Ages 5-17 in the State

132,844

Children without Full Access

37,297 (28.1%)

Full Access by Income

Figure 1: Children Ages 5-17 in Households with Full Digital Access (both broadband internet and a device) by Income Level Estimated as Below or Above the Federal Poverty Threshold

- 83% of children living in under-resourced households (below the federal poverty threshold) have a device other than a smartphone, compared to 94% of children in households at higher income levels.
- 53% of children in under-resourced households have broadband access; 76% at higher income levels.

Full Access by Race/Ethnicity

Figure 2: Children Ages 5-17 in Households with Full Digital Access (both broadband internet and a device) by Race/Ethnicity. +At times, this report uses terms from U.S. Census data (e.g., American Indian/Alaskan Native) and not NEA-inclusive groupings.

- 80% of American Indian/Alaskan Native children have access to a device other than a smartphone at home, as compared to 97% of White children. 54% of American Indian/Alaskan Native children have access to broadband.
- 91% of Hispanic/Latinx children have a device at home, and 74% have access to broadband internet.

Who Lacks Full Digital Access?

39% of children in households with at least one unemployed parent

26% of children in households with a parent at home for remote learning

18% of children in households with a member of the essential workforce

39% of children with parents without a bachelor's degree

18% of children in metro households

34% of children whose parents are renters

59% of children in non-metro households

26% of children whose parents are homeowners

49%

of children in under-resourced households lack full digital access

36%

of Native students and students of color do not have access to broadband and a device

36%

of teachers do not have access to broadband and a device at home

Arizona

K-12 Student Digital Access

This is a summary of the estimated digital access for Arizona. The state-level profile is based on the latest available American Community Survey (ACS) micro-level data from 2018. The analysis was prepared by researchers at Public Policy Associates, Inc. (PPA) on behalf of the NEA. Because of standard errors, apparent differences might not be statistically significant. Full digital access includes both broadband and a device.

Children Ages 5-17 in the State

1,195,104

Children without Full Access

329,776 (27.6%)

Full Access by Income

Figure 1: Children Ages 5-17 in Households with Full Digital Access (both broadband internet and a device) by Income Level Estimated as Below or Above the Federal Poverty Threshold

- 74% of children living in under-resourced households (below the federal poverty threshold) have a device other than a smartphone, compared to 92% of children in households at higher income levels.
- 55% of children in under-resourced households have broadband access; 80% at higher income levels.

Full Access by Race/Ethnicity

Figure 2: Children Ages 5-17 in Households with Full Digital Access (both broadband internet and a device) by Race/Ethnicity. +At times, this report uses terms from U.S. Census data (e.g., American Indian/Alaskan Native) and not NEA-inclusive groupings.

- 84% of Hispanic/Latinx children have access to a device other than a smartphone at home, as compared to 97% of White children. 68% of Hispanic/Latinx children have access to broadband.
- 60% of American Indian/Alaskan Native children have a device at home, and 34% have access to broadband internet.

Who Lacks Full Digital Access?

30% of children in households with at least one unemployed parent

24% of children in households with a parent at home for remote learning

19% of children in households with a member of the essential workforce

35% of children with parents without a bachelor's degree

26% of children in metro households

39% of children whose parents are renters

63% of children in non-metro households

21% of children whose parents are homeowners

49%

of children in under-resourced households lack full digital access

36%

of Native students and students of color do not have access to broadband and a device

18%

of teachers do not have access to broadband and a device at home

Arkansas

K-12 Student Digital Access

This is a summary of the estimated digital access for Arkansas. The state-level profile is based on the latest available American Community Survey (ACS) micro-level data from 2018. The analysis was prepared by researchers at Public Policy Associates, Inc. (PPA) on behalf of the NEA. Because of standard errors, apparent differences might not be statistically significant. Full digital access includes both broadband and a device.

Children Ages 5-17 in the State

509,302

Children without Full Access

214,427 (42.1%)

Full Access by Income

Figure 1: Children Ages 5-17 in Households with Full Digital Access (both broadband internet and a device) by Income Level Estimated as Below or Above the Federal Poverty Threshold

- 67% of children living in under-resourced households (below the federal poverty threshold) have a device other than a smartphone, compared to 89% of children in households at higher income levels.
- 42% of children in under-resourced households have broadband access; 67% at higher income levels.

Full Access by Race/Ethnicity

Figure 2: Children Ages 5-17 in Households with Full Digital Access (both broadband internet and a device) by Race/Ethnicity. +At times, this report uses terms from U.S. Census data (e.g., American Indian/Alaskan Native) and not NEA-inclusive groupings.

- 67% of African-American/Black children have access to a device other than a smartphone at home, as compared to 89% of White children. 52% of Black children have access to broadband.
- 77% of Hispanic/Latinx children have a device at home, and 53% have access to broadband internet.

Who Lacks Full Digital Access?

47% of children in households with at least one unemployed parent

39% of children in households with a parent at home for remote learning

41% of children in households with a member of the essential workforce

51% of children with parents without a bachelor's degree
